Data Science 6th Semester

1. Introduction

The Student Performance Analytics project is developed using Power BI to analyze student academic performance and related behavioral trends. The dashboard helps users understand student progress through interactive charts, KPIs, and reports. The project aims to provide meaningful insights that support educational planning and data-driven decision-making.

Tables Relational schema of this project

2. Methodology

The project follows a structured data analytics methodology. First, the dataset was collected and cleaned to remove inconsistencies and missing values. After data preprocessing, the dataset was imported into Power BI where relationships and visualizations were created. Interactive dashboards were designed using charts, cards, slicers, and tables to present insights effectively.

- Data Collection
- Data Cleaning and Transformation
- Data Modeling
- Dashboard Development
- Visualization and Analysis
- Insight Generation

3. Dataset

The dataset used in this project contains information related to students' academic performance, attendance, and behavioral indicators. The dataset was used to generate insights and compare performance trends among students.

The source of dataset is Kaagle

- New Measure
- Attendance csv
- Behavior csv
- Scores csv

4. Dashboard

The Power BI dashboard provides an interactive environment for analyzing student performance. Different visualizations are used to display trends, comparisons, and performance metrics in a simple and understandable format.

- Interactive Slicers and Filters
- KPI Cards
- Bar Charts and Pie Charts

- Student Performance Analysis
- Attendance Tracking
- Comparative Analysis
